Med SWOT experiment – May 2018

A synergy among three programs:

1. BIOSWOT (SWOT-ST; A. Doglioli, G. Gregori, F. d'Ovidio: MIO, LOCEAN-IPSL; F. Cyr NAFC, St John's)
2. PROTEVS_SWOT (F. Dumas, P. Garreau SHOM)
3. PRE-SWOT (A. Pascual: SWOT-ST, IMEDEA, SOCIB)

One common objective..

Evaluate the interest of the west Med SWOT crossover

Gain experience in multi-platform, multi-lateral campaign coordination

Explore the dynamics of the region

Platforms and instruments

R/V García del Cid
(CSIC, Spain)

5-16 May 2018

BHO Beautemps-Beaupré
(SHOM France)

28 April – 14 May 2018

Drifters
(CSIC, SOCIB, SHOM)

Slocum glider
(SOCIB, Spain)

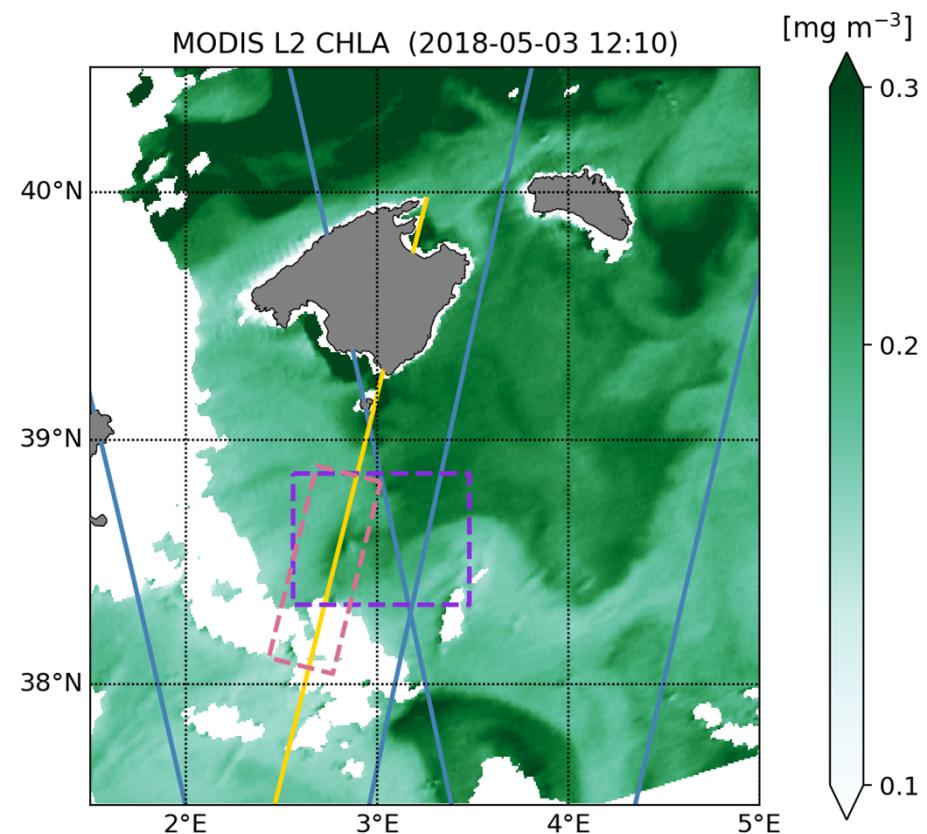

SeaExplorer glider
(MIO, France)

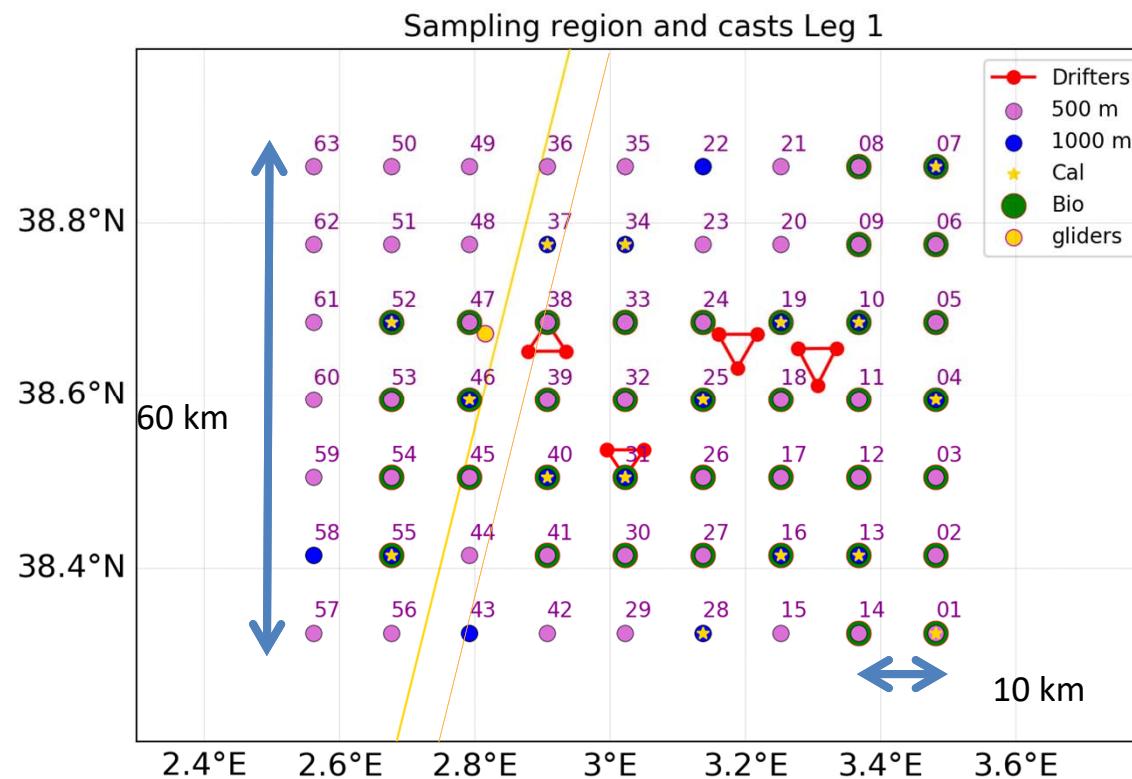

Determining the area of study from satellite data

- Leg-1
- Leg-2
- SWOT swaths
- Sentinel-3 244 Track

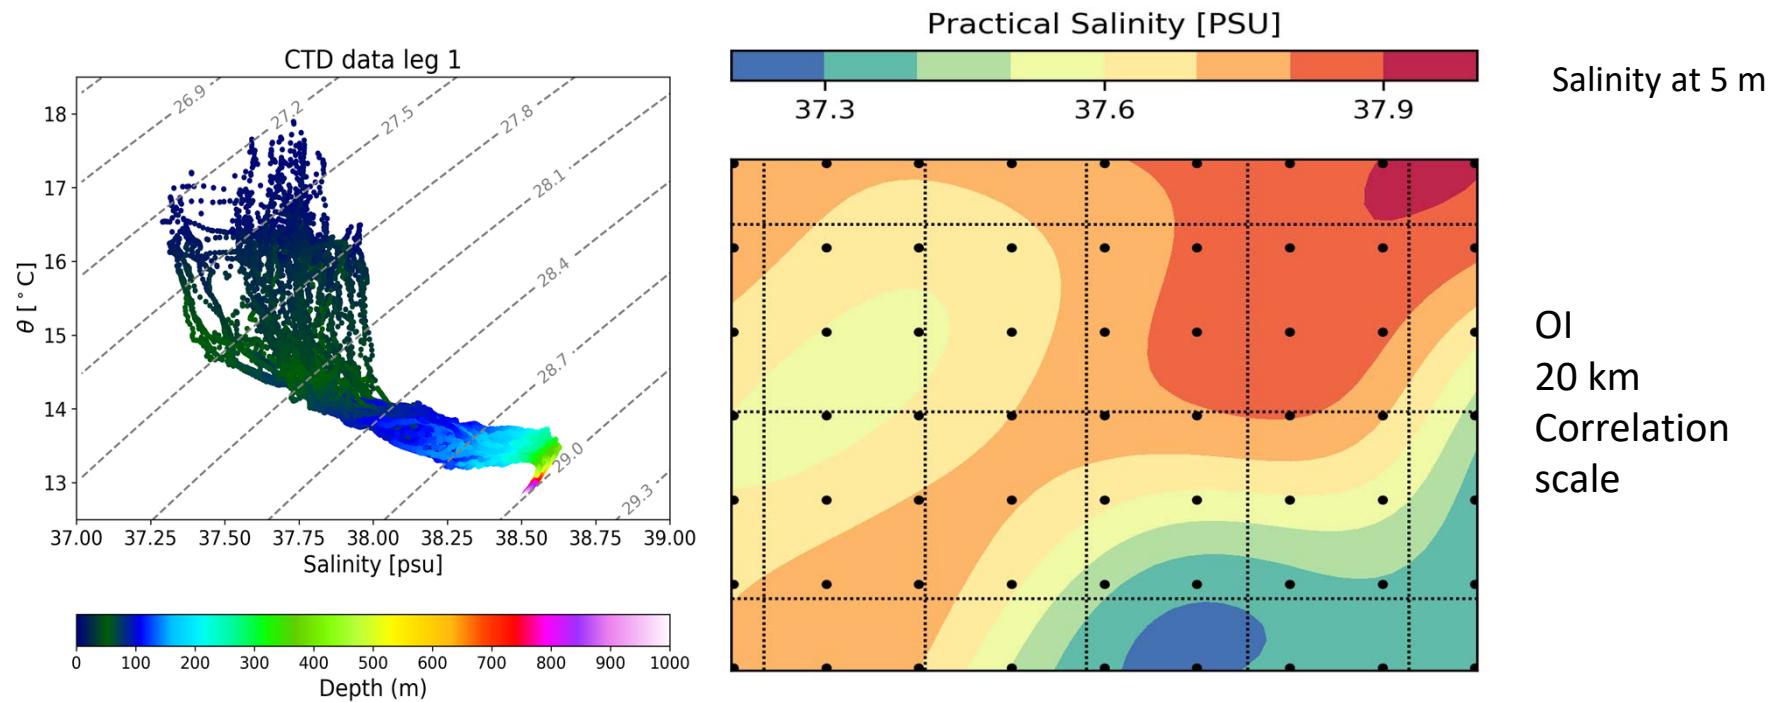

PRE-SWOT sampling design (Leg-1)

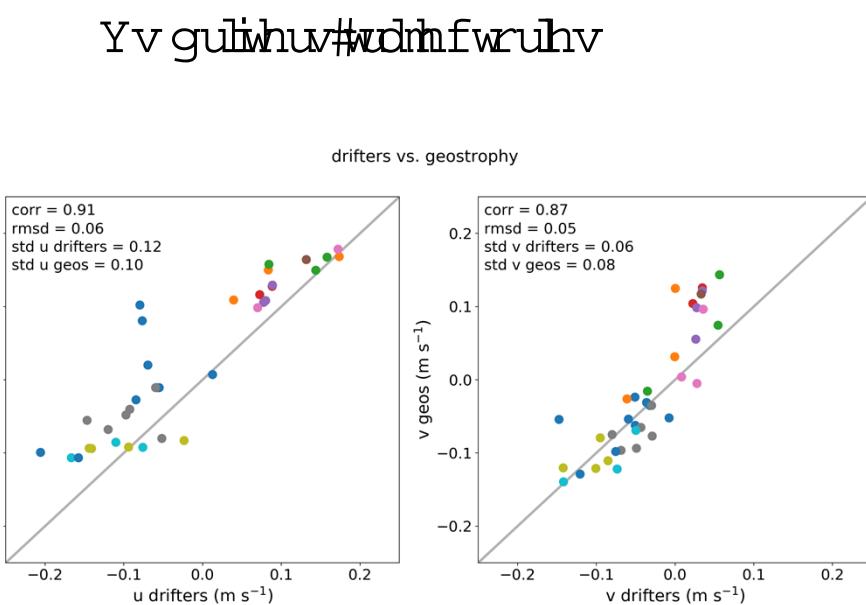

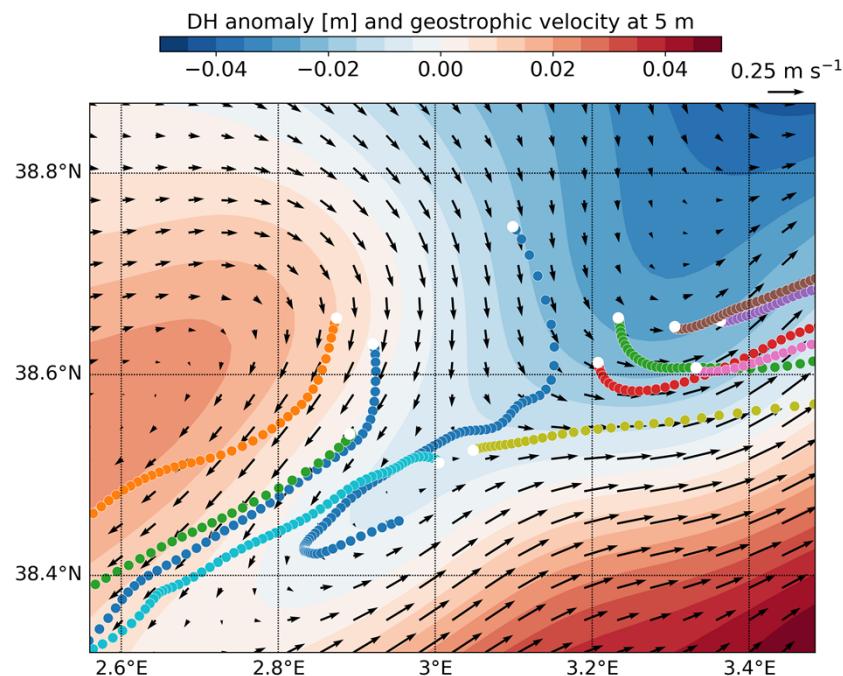

- Mimic SWOT swath width and resolved scales
- Radiator grid covered 100 % in 4.5 days
- All data QC and public (DOI)
- Cruise report (DOI)

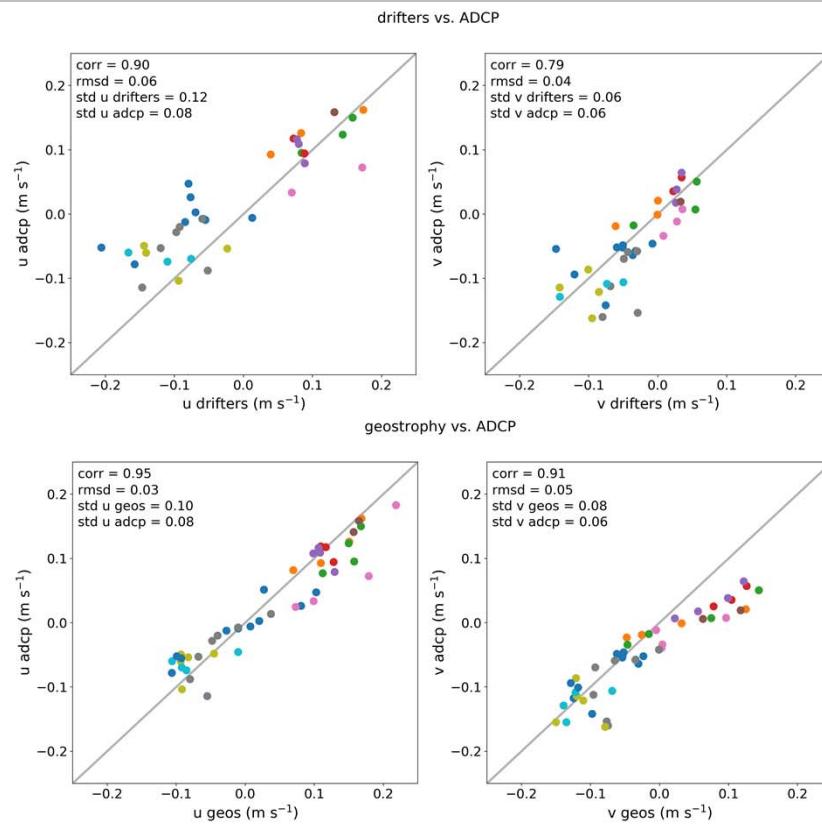

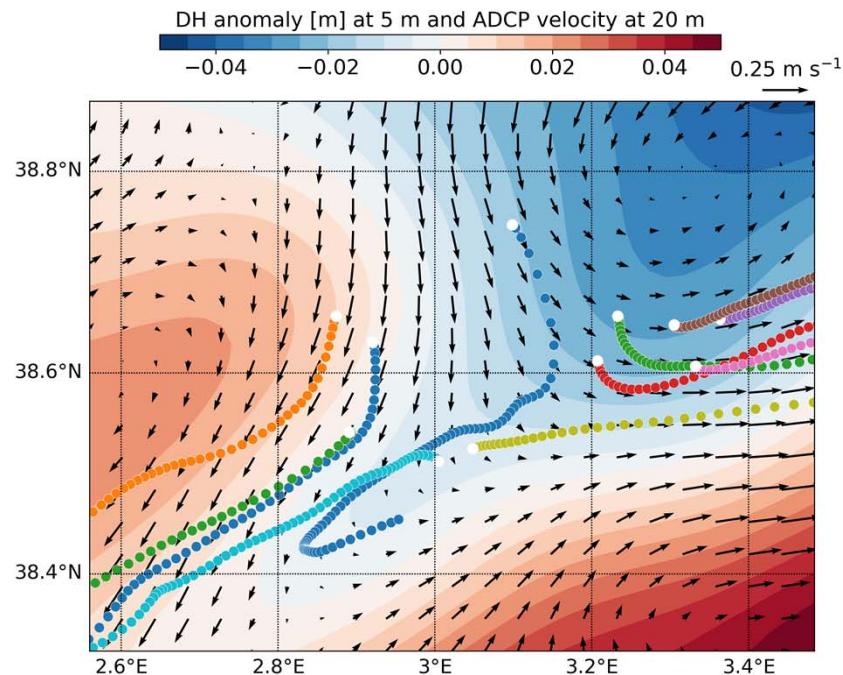

Water masses - salinity front

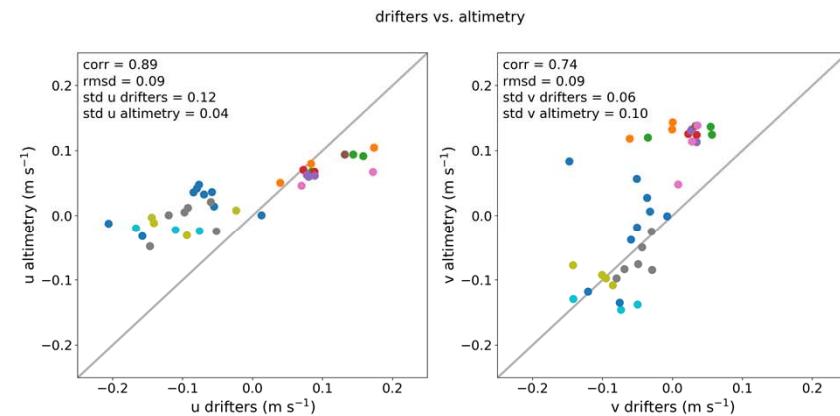

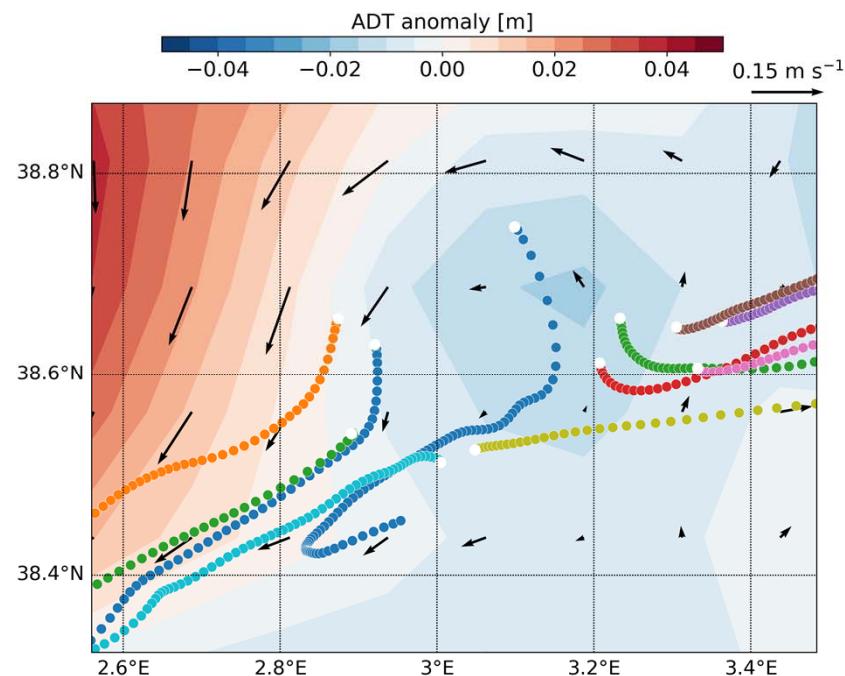

Dynamic Height – Geostrophic Velocity

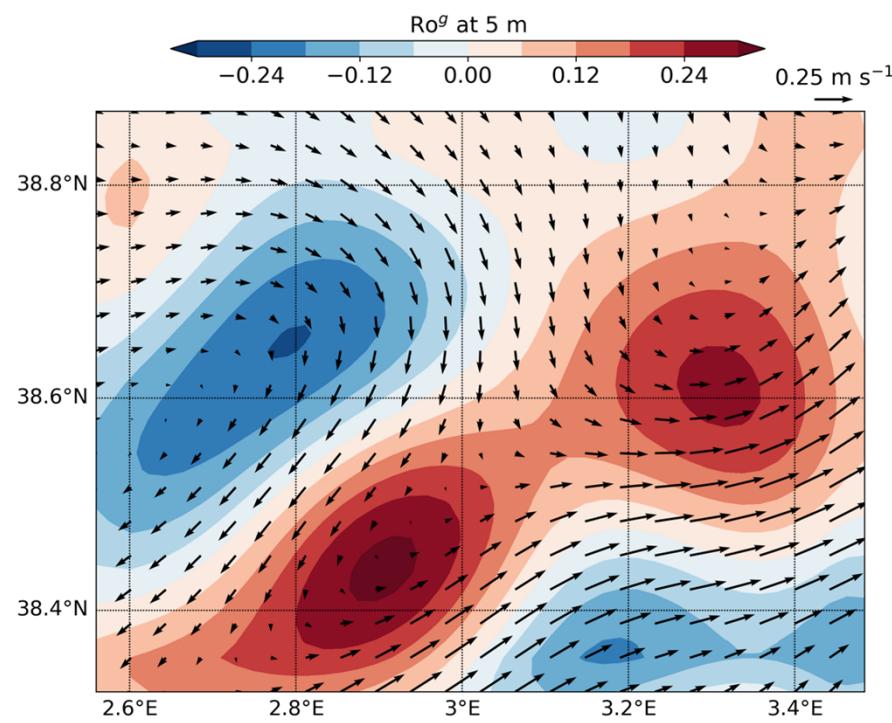

Dynamic Height – ADCP

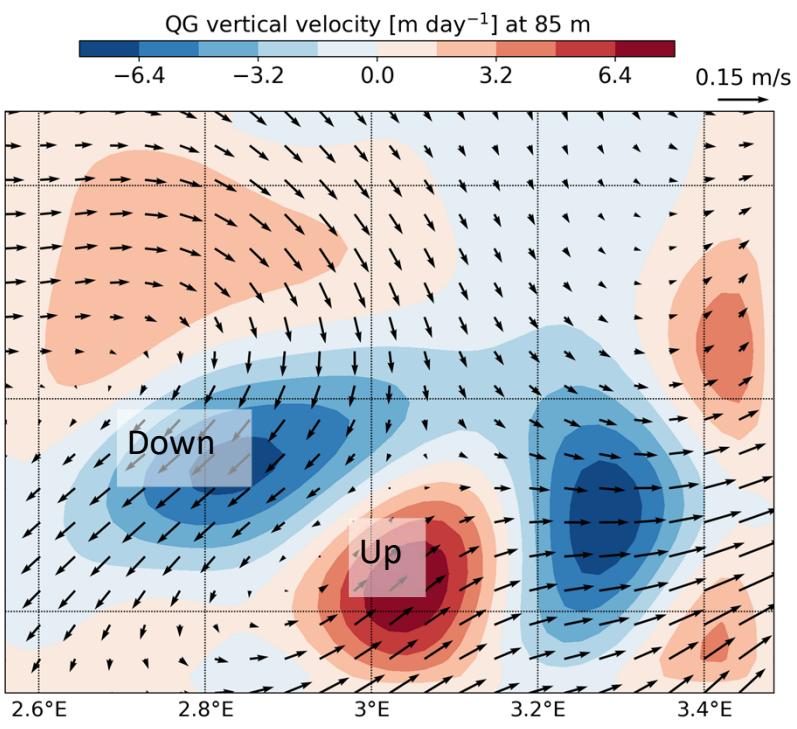

DUACS gridded altimetry

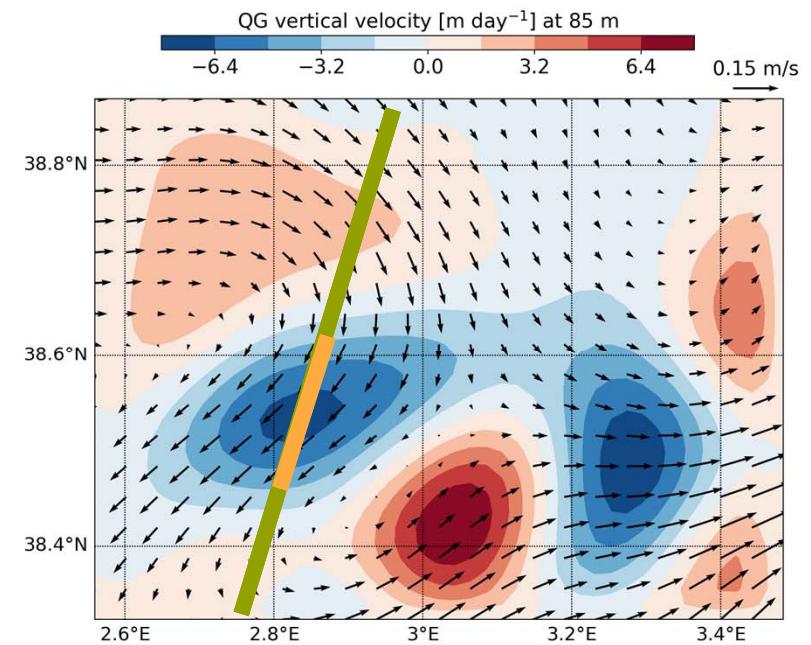

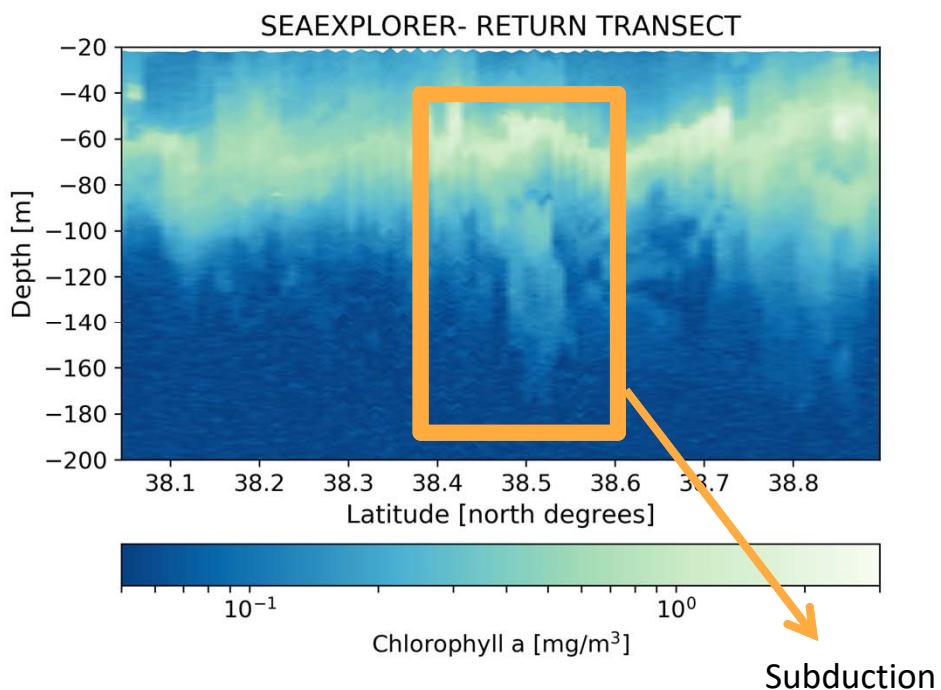

Relative vorticity

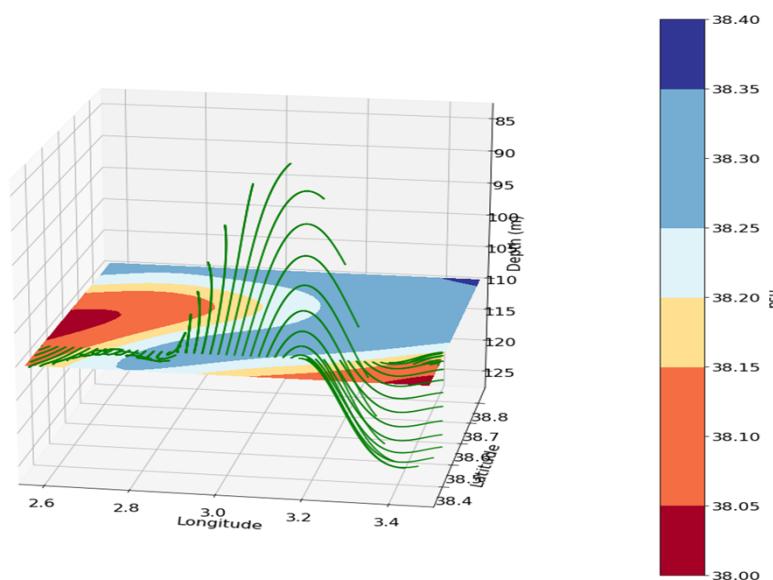

QG-vertical velocity

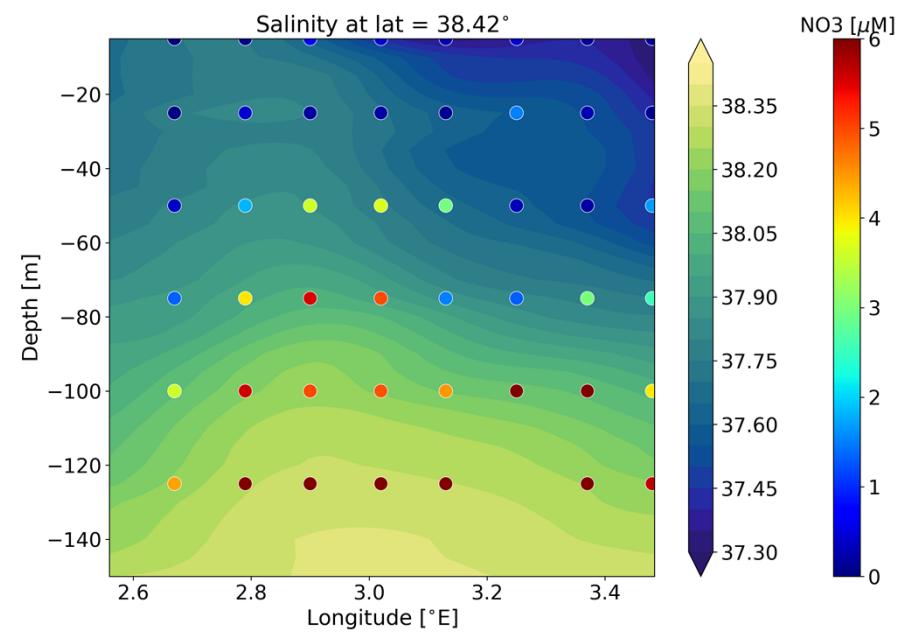

Chl subduction - glider

Particle trajectories and nutrient distributions

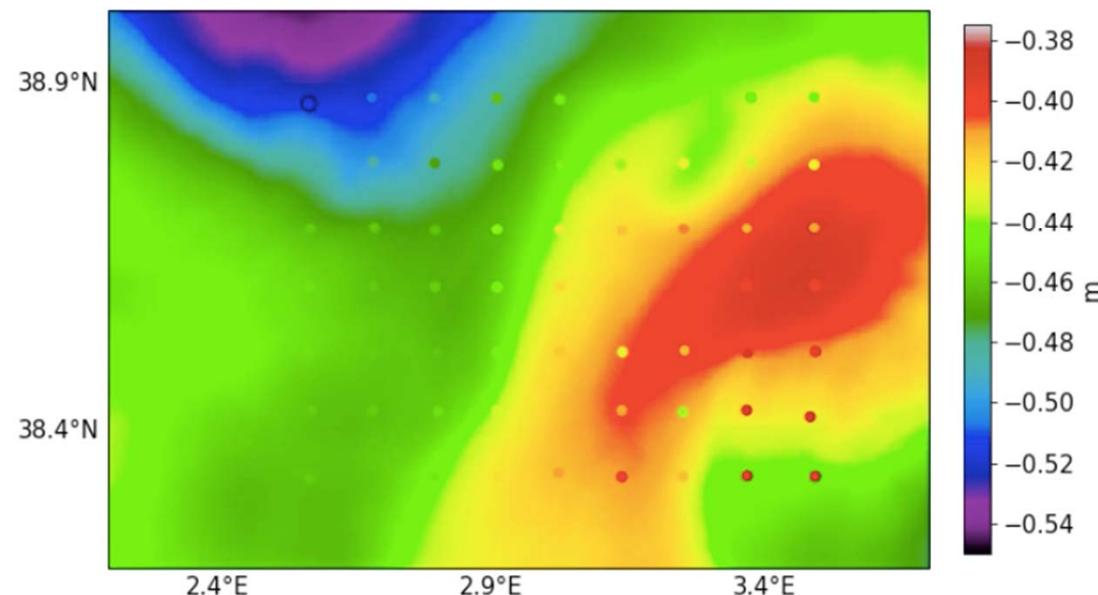

3D trajectories using PARCELS. Particles have been advected with geostrophic and QG-w velocities. Parcels trajectories after 120 hours.

Nutrient and salinity vertical distribution

Synopticity – temporal scales

RESEARCH ARTICLE

10.1029/2018JC014636

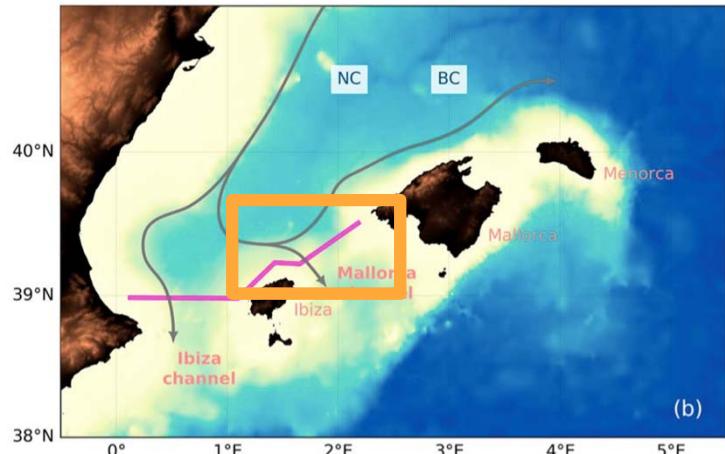

Key Points:

- High-frequency variability dominates the circulation and transport across the channel
- The characteristic horizontal dimension of mesoscale instabilities in this region is 6.0 km

Temporal and Spatial Hydrodynamic Variability in the Mallorca Channel (Western Mediterranean Sea) From 8 Years of Underwater Glider Data

Bàrbara Barceló-Llull¹ , Ananda Pascual¹ , Simón Ruiz¹ , Romain Escudier² , Marc Torner³, and Joaquín Tintore^{1,3} 

¹IMEDEA (UIB-CSIC), Esporles, Spain, ²CMCC, Bologna, Italy, ³SOCIB, Palma de Mallorca, Spain

Analysis of historical glider data in Mallorca Channel (covered by SWOT fast sampling orbit)

- Characteristic horizontal scale (Rossby radius of deformation) of 6 km
- Eddies radius ranging from 5 to 18 km
- Temporal variability of circulation and transport over timescales of weeks stronger than seasonal changes

Barceló-Llull et al. JGR 2019

Summary

- Need of integrated multi-platform and interdisciplinary approach for understanding fine-scale processes.
- Small scale processes in the west Med.
- Integration with modeling (see also poster by Laura Gómez-Navarro et al. on denoising techniques and SWOT simulator applied to NATL60, HYCOM, MITgcm).

Future plans

- Contribute to SWOT Science Team and Adopt-A-Crossover initiative: multi-platform experiment in Western Mediterranean Crossover
 - Similar strategy as in PRE-SWOT, in coordination with French team (probably better if both ships were at the same location to reduce synopticity issues).
 - Include moorings - ideally 3 with CTDs and currentmeters, separated ~10 km (collaboration with U. Send, Scripps).
 - Synergies with CALYPSO or other programs ? Lagrangian floats, AUVs, gliders, drifters,...
 - Which funding ??
- Collaboration in other crossovers (e.g. California, Antarctica,...)
- Open questions
