### **Surface Water and Ocean Topography Mission (SWOT) Mission**

# L2\_HR **River Processing Science Team Meeting**

### **Cassie Stuurman, 2021-09-15** with contributions from many others (presented by Curtis Chen)

## Outline **SWOT L2\_HR River Processing**

- 1. River processors review
- 2. Review river algorithms
  - Pixel assignment

SWOT

- ii. Aggregation to nodes
- Aggregation to reaches iii.
- 3. Considerations for science users
  - Expected sources of error
- 4. Summary & questions

# **River Processors Review**

There are three river processors:

SWOT

1. **RiverTile:** Input pixel cloud  $\rightarrow$  River heights, widths, areas, & slopes

2. **RiverSP**: 

3. **RiverAverage:** Input RiverSP granules from multiple orbit cycle passes Averaged heights, slopes, and widths

## **River Processor Inputs Pixel Cloud Product**

- InSAR-derived 3D pixel product
  - Latitude, longitude, height (*wrt ref ellipsoid*)
    - Also includes geoid & tide corrections that are removed during river processing
- Pixel type classes

SWOT

- Land, water body, water edge, etc.
- Considerations for science users:
  - Dark water
  - Measurement geometry/geolocation

- associated sources of error

## **River Processor Inputs** SWORD

SWOT River Database (SWORD)

SWOT

science info for river algorithms as well as science users

- A global prior river database (PRD) containing reach/node information, discharge parameters, dam/waterfall identifiers, multichannel information, and other prior

### RiverAvg product

SWOT\_L2\_RiverAvg\_007\_74

Shown on LANDSAT basemap

![](_page_7_Figure_10.jpeg)

## **River Algorithms Fundamental concepts**

SWOT

- 3-D pixel clouds mapped to input river nodes from SWORD
- All water classes in tile are potential river pixels
- Various thresholds are used to distinguish river pixels from other water bodies in scene

![](_page_8_Figure_6.jpeg)

Copyright 2021 California Institute of Technology. Government sponsorship acknowledged.

![](_page_8_Picture_8.jpeg)

![](_page_8_Picture_18.jpeg)

## **River Algorithms Fundamental concepts**

SWO

- 3-D pixel clouds mapped to input river nodes from SWORD
- All water classes in tile are potential river pixels
- Various thresholds are used to distinguish river pixels from other water bodies in scene
  - Defined in s (along-reach) and n (tangent)

![](_page_9_Figure_7.jpeg)

## **River Algorithms Fundamental Concepts**

SWOT

At a high level, river processing:

- 1. Segments input pixel cloud by contiguous water classes
- 2. Identifies labels associated with the channel centerline
- 3. Maps all pixels within channel label to nearest SWORD node
- 4. Aggregates pixel information to node information
- 5. Aggregates node information to reach information
- **Outputs** products 6.

# Segmentation

SWOT

- Lakes connected to river in slant plane can be included within the in-channel segment
  - Hence the thresholds

![](_page_11_Figure_4.jpeg)

Copyright 2021 California Institute of Technology. Government sponsorship acknowledged.

# Segmentation

SWOI

- Lakes connected to river in slant plane can be included within the in-channel segment
  - Hence the thresholds
- For various reasons, the pixel cloud may be discontinuous even within the river channel

### **Segmentation on simulated data**

jpl.nasa.gov

# Pixel assignment

SWO

- The segmentation information combined with prior width information are used to determine which pixels are "in\_channel"
- Pixels are assigned to nodes according to their shortest distance
- Pixels outside the "in\_channel" thresholds are not assigned to any node

![](_page_13_Figure_6.jpeg)

## Pixel assignment to nodes in\_channel thresholds

SWOT

### Each node's in\_channel bounds form a **rectangle**

 $\mathbf{S}$ 

Grey = detected water pixels For illustration purposes, not to scale

16

### **Two thresholds per node:**

SWOT

- 1. <u>Search rectangle</u>: the distance threshold in which pixels are *always* included

![](_page_16_Figure_4.jpeg)

2. Extreme distance: the distance up to which pixels within the segmentation label are included

jpl.nasa.gov

## Pixel assignment **Unique assignment**

SWOI

- After iterating through all nodes in all reaches, pixel assignment now finished
- Most assigned pixels are river channel pixels, but some pixels may be assigned incorrectly
  - Mid-size tributaries (not in SWORD)
  - Lake-near-river pixels
  - Missing pixels due to dark water or other errors

![](_page_22_Figure_8.jpeg)

Copyright 2021 California Institute of Technology. Government sponsorship acknowledged.

jpl.nasa.gov

## Pixel assignment Things to be aware of

SWOT

- Pixel assignment often errs on the side of **keeping** pixels
  - False positives due to non-channel waterbodies near SWORD centerline are common
    - e.g. unknown lakes-near-river or artificial reservoirs, moderate width tributaries (not in SWORD), etc.
  - Coherence time/azimuth smearing can also result in increased false positives
    - Somewhat mitigated by water fraction approach
  - Mean/median area error (%) often positive in our simulations
    - i.e. river processor tends to over-estimate area

### **Example pixcvec output**

![](_page_23_Figure_17.jpeg)

![](_page_23_Picture_30.jpeg)

## Pixel assignment Things to be aware of

SWOT

- Pixel assignment often errs on the side of keeping pixels
  - False positives due to non-channel waterbodies near SWORD centerline are common
    - e.g. unknown lakes-near-river or artificial reservoirs, moderate width tributaries (not in SWORD), etc.
  - Coherence time/azimuth smearing can also result in increased false positives
    - Somewhat mitigated by water fraction approach
  - Mean/median area error (%) often positive in our simulations
    - i.e. river processor tends to over-estimate area
- Pulling in bad pixel heights can contaminate node-level information
  - Node-level wse/area outliers are relatively common
  - Design philosophy is to **include, but flag** bad nodes, and weight accordingly for reach-level aggregation stats

### **Example pixcvec output**

![](_page_24_Picture_36.jpeg)

# **Pixel Aggregation to Nodes**

SWOT

### • Following assignment, pixel information is aggregated to node-level information

- Each pixel from the input pixel cloud has a height, area, water fraction, and associated uncertainties

Copyright 2021 California Institute of Technology. Government sponsorship acknowledged.

![](_page_25_Picture_18.jpeg)

# **Pixel Aggregation to Nodes**

SWOI

- Following assignment, pixel information is aggregated to node-level information - Each pixel from the input pixel cloud has a height, area, water fraction, and
- associated uncertainties
- For area aggregation, account for pixel area and estimated water fraction to find total area (sum of all estimated pixel areas)

 $\hat{A}_{f,\alpha} =$ 

$$\sum_{x} A(x)\hat{\alpha}(x)I_f(x)$$

Copyright 2021 California Institute of Technology. Government sponsorship acknowledged.

![](_page_26_Picture_17.jpeg)

# **Pixel Aggregation to Nodes**

- Following assignment, pixel information is aggregated to node-level information - Each pixel from the input pixel cloud has a height, area, water fraction, and
- associated uncertainties
- For area aggregation, account for pixel area and estimated water fraction to find total area (sum of all estimated pixel areas)

 $\hat{A}_{f,\alpha} =$ 

noise variance (i.e. inverse variance weighting)

$$\hat{h}_f = \sum w(x)h(x)I_{f,h}(x)$$

SWO

$$\sum_{x} A(x)\hat{\alpha}(x)I_f(x)$$

For **height** aggregation, take the *mean* height using weights based on the phase

$$w(x) = \frac{\sigma_h^{-2}(x)}{\sum_x \sigma_h^{-2}(x) I_{f,h}(x)} = \frac{d_h^{-2}(x) \sigma_\phi^{-2}(x)}{\sum_x d_h^{-2}(x) \sigma_\phi^{-2}(x) I_{f,h}(x)}$$

![](_page_27_Picture_22.jpeg)

# Node aggregation to reaches

For the reaches.shp output product, combine node-level height and area data into reach-level heights, areas, and slope

SWOI

- Reach-level area is the sum of all node areas
- Reach-level wse is the estimated height at the along-reach center defined by SWORD

- Height is estimated using estimated reach slope

- Reach slope is currently calculated as a weighted linear fit to the reach using pixels from only that reach
  - May change due to frequency of non-linear reaches in simulation dataset; exploring option to include information from adjacent reaches
  - Slope is only available at the reach level (not for individual nodes)

Reach and node heights are reported relative to geoid with corrections for solid Earth, load, pole tides

### RiverSP shapefiles

![](_page_29_Figure_4.jpeg)

![](_page_29_Picture_6.jpeg)

# **River Average Product**

• The RiverAverage product provides basin-scale (Pfafstetter 2) SWOT-derived reach information averaged over the ~21-day repeat cycle

SWO

- Observations per cycle range from 1-36, depending primarily on latitude
- Reach-level information only (no nodes)
- Aim is to provide temporally averaged data for large scale hydrological models

### RiverAvg product

![](_page_30_Picture_11.jpeg)

SWOT\_L2\_RiverAvg\_007\_74

Copyright 2021 California Institute of Technology. Government sponsorship acknowledged.

![](_page_30_Picture_15.jpeg)

SWOT

- with min, med, and max wse

![](_page_31_Figure_5.jpeg)

## Summary **SWOT River Processing**

- single-pass shapefiles
- Cycle-average product gives reach-level information per 21 day orbit cycle
- Considerations:
  - Pixel assignment errors can cause height, slope, or area errors
    - Bad nodes, various node flags
  - Upstream factors
- Dark water, phase unwrapping, water-water layover

SWOT

• River processing takes input pixel cloud and SWORD data to generate reach and node

• Pixel assignment distinguishes river channel pixels from land & other waterbodies
